

2008 Lower Michigan Fire Weather Operating Plan

INTRODUCTION:

This Fire Weather Annual Operating Plan (FWAOP) was developed to enhance the communication and organization between members of The National Weather Service along with federal and state user agencies, for the 2008 fire season. This AOP was written from information compiled in The National Weather Service Directive 10-4, and the 2007 FWAOP.

APPENDICES:

- Catalog of fire weather observation sites (Appendix A)
- Internet Spot Forecast request procedures (Appendix B)
- Example of products issued (Appendix C)
- Fire Weather Indices (Appendix D)

SERVICE AREA and ORGANIZATION:

Service Areas:

The National Weather Service Office in Gaylord will prepare Fire Weather Forecasts, Point (NFDRS) Forecasts, Spot forecasts, and Red Flag event support for the following fire control/land management agencies in Lower Michigan:

- Huron-Manistee National Forest in northern lower Michigan along and north of M-55
- Sleeping Bear Dunes National Lakeshore in northern lower Michigan
- State forest lands along and north of M-55 in northern lower Michigan

National Weather Service Office in Grand Rapids will prepare Fire Planning Weather Forecasts, Point (NFDRS) Forecasts, Spot forecasts, and Red Flag event support for the following fire control/land management agencies in Lower Michigan:

- Huron-Manistee National Forest in west-central lower Michigan south of M-55
- State forest lands south of M-55 in southwest lower Michigan

National Weather Service Office in White Lake Township, MI will provide Fire Weather Planning Forecasts, Red Flag event support and Spot Fire Weather Forecasts in Lower Michigan for the following fire control/land management agencies:

- Shiawassee National Wildlife Refuge in lower Michigan
- State and local land management agencies across southeast Michigan

National Weather Service Office in Northern Indiana will provide Fire Weather Planning Forecasts and Spot Fire Weather Forecasts for the following fire control/land management agency in Michigan:

- State and local land management agencies in Berrien, Cass, St. Joseph, Branch and Hillsdale counties

Backup:

In events in which the National Weather Office Gaylord cannot provide routine services, as laid out in this FWAOP, then the National Weather Service Office Marquette will assume responsibility for fire weather products and services needed over northern Lower Michigan. In the event the National Weather Service Office Marquette cannot provide routine services as laid out in their FWAOP, then the National Weather Service Office Gaylord will assume responsibility for all fire weather products and services needed over Upper Michigan.

The National Weather Service Office in Marquette prepares the fire weather products for the following fire control/land management agencies in Upper Michigan.

- Ottawa National Forest in upper Michigan
- Hiawatha National Forest in upper Michigan
- Isle Royale National Park in Lake Superior
- Pictured Rocks National Lakeshore in upper Michigan
- Seney Wildlife Refuge in upper Michigan

Similarly, the National Weather Service in White Lake will be the back up for the Grand Rapids office for routine fire weather services. In turn, Grand Rapids will back up the White Lake office for routine fire weather services.

The National Weather Service in Indianapolis will serve as back up for the National Weather Service in Northern Indiana.

Routine Services provided by the National Weather Service:

Format of Fire Planning Weather Forecasts and times of issuance are coordinated with the customers at the beginning of each season. The format of the fire weather products will comply with standards set forth in NWS Instruction 10-401. The format is standardized, in an effort to better serve transient fire fighters. The fire fighters can look at any National Weather Service Fire Weather Forecasts, and be familiar with the format so that critical weather information can be easily obtained.

The National Fire Danger Rating System (Point) forecasts will be issued to determine fire danger on an as needed basis. These are initiated by the reception of 1300 (local time) observation at the designated points.

Special forecasts, such as Spot Forecasts, will be issued as needed for on-going fires, prescribed burns, spraying or other special projects of the fire protection agencies.

A red flag program will be maintained throughout the fire season, to support fire agencies in wildfire prevention and suppression tactics.

Close liaison between the National Weather Service and the fire control agencies will be maintained to insure a smooth exchange of essential information.

Below are the fire weather products issued by Weather Forecast Office Gaylord:

- ARBFWFAPX- Routine Fire Weather Forecast
- ARBFWMAPX- NFDRS (point) forecasts (Mio, Bear, Wellston, and Silver Creek)
- ARBFW SAPX- Spot Forecasts
- ARBRFWAPX- Fire Weather Watch or Red Flag Warning

Below are the fire weather products issued by Weather Forecast Office Grand Rapids:

- ARBFWFGRR- Routine Fire Weather Forecast
- ARBFWMGRR- NFDRS (point) forecasts (Baldwin)
- ARBFWSGRR- Spot Forecasts
- ARBRFWGRR- Fire Weather Watch or Red Flag Warning

Below are the fire weather products issued by Weather Forecast Office White Lake:

- ARBFWFDTX- Routine Fire Weather Forecast
- ARBFWSDTX- Spot Forecasts
- ARBRFWDTX- Fire Weather Watch or Red Flag Warning

Below are the fire weather products issued by Weather Forecast Office Northern Indiana:

- INDFWFIWX- Routine Fire Weather Forecast

- INDFWSIWX- Spot Forecasts
- INDRFWIWX- Fire Weather Watch of Red Flag Warning

More specific information on the above products is provided below.

Routine Fire Weather Forecast-

This forecast has two scheduled issuances, between 400 am and 700 am in the morning, and between 300 pm and 400 pm in the afternoon. The morning forecast will contain three periods and an extended portion, while the afternoon forecast will contain four periods and an extended forecast.

The forecasts will contain the following elements:

- **Headline** - The headline should capture the most important aspect of the forecast, or a trend. If a Red Flag Warning or Fire Weather Watch is in effect, then this becomes the headline.
- **Discussion** – This is a short paragraph outlining the synoptic features affecting the Great Lakes region during the next 24 to 36 hours.
- **Other forecast elements** will include: cloud cover, chance and type of precipitation, precipitation amount, max and min temperatures and its trend, max and min relative humidity and its trend, 10 meter morning and afternoon winds in MPH, mixing height in 1000 of feet, and transport winds in knots.
- **Haines Index** - This is a stability index with reportable values that range from 2 to 6. You can calculate the Haines Index by using model soundings.
- **Ventilation Index (VI)** - A smoke management tool used to measure the stability of the atmosphere, in order to indicate how effectively it will disperse fire generated pollutants.
- The extended forecast will be appended to the end of the tabular part of the product and will include the winds through day 7.

This forecast will be updated whenever the following conditions are warranted.

- A Fire Weather Watch is issued, cancelled or expired
- A Red Flag Warning is issued, cancelled or expired

Methods of receiving and accessing routine Fire Planning Weather Forecasts, is as follows:

- Agencies can routinely access the forecast via the internet at weather.gov/gaylord, weather.gov/grandrapids, weather.gov/detroit, weather.gov/northernindiana or through WIMS (Weather Information and Management System).
- If the above options are not available, then agencies are encouraged to call the respective National Weather Service Office directly.

NFDRS (point) Forecast -

The Point Forecast is issued for a specific point within the fire weather area of responsibility (see stations below) and is valid for a twenty-four (24) hour period (through 100 pm the following day). For example, if the NPS wants a Point Forecast for Wednesday at “The Bear”,

they will send the 100 pm weather conditions from the site on Tuesday to serve as a reference for the forecast. The Point Forecast for The Bear, would be valid through 100 pm the next day (in this case it would be a Point Forecast for Wednesday at 100 pm at BEAR).

Point forecast Stations:

<u>Station</u>	<u>ID #</u>	<u>COUNTY</u>	<u>AGENCY</u>	<u>LAT</u>	<u>LONG</u>
Office: GRR					
Baldwin	203802	Lake	USFS	43.9	85.8
Office: APX					
Mio	202902	Oscoda	USFS	44.4	84.1
Bear	202010	Leelanau	NPS	44.5	86.0
Wellston	203101	Manistee	USFS	44.2	85.9
Silver Creek	203601	Iosco	USFS	44.4	83.6

The format for NFDRS forecast is found in NWS Instruction 10-401.

Spot Forecasts-

This forecast is prepared for a single location for a very distinct period of time, usually 6 to 12 hours. The forecast is usually requested by federal and state agencies during wildfires or prescribed burns.

The forecast elements will usually consist of the highest or lowest temperature during the period, the highest or lowest relative humidity, wind direction and speed, chances of precipitation and duration.

Spot Forecast requests can come into the office by several means, the internet, by fax, or by phone. The preferred method for requesting or receiving Spot Forecasts will be via the internet. If internet usage is not possible for requesting or receiving Spot Forecasts, then requesting agencies should call the respective NWS office to request the forecast.

Instructions for submitting a Spot Forecast request by user agencies, and instructions for completing the Spot Forecast by National Weather Service employees via the internet, are found in Appendix B.

When a request for a Spot Forecast is made by phone, National Weather Service employees should use the Spot Forecast form to help prepare the forecast. Upon receiving a call for a Spot Forecast, the NWS forecaster should ask for the location lat/lon, current observation including temperatures, relative humidity, wind direction and speed location. Elevation, aspect, fuel type, and requesting official and contact phone number should also be given for the site before beginning the forecast process.

Whether the Spot Forecast request is made by phone or the internet, NWS employees will complete the request utilizing the internet process (Appendix B). When the forecast is submitted it will produce a product in AWIPS, which is printed automatically and stored locally.

This form can be used for faxing.

Red Flag Services:

Fire Weather Watches and Red Flag Warnings -

A Fire Weather Watch or Red Flag Warning event occurs whenever extremely dry fuels combine with critical weather parameters to create an atmosphere that could contribute to extensive wildfires with the potential to threaten life and property. Any watch or warning should be coordinated with the affected land management agency for the zone where the watch or warning was issued.

A Red Flag warning may also be requested by a land management agency, if they feel that due to extreme dryness in the forest, that wildfires are likely. Otherwise, if conditions are expected to be close to or exceed red flag conditions, then an appropriate statement should be put into the Hazardous Weather Outlook (ARBHWOxxx).

Fire Weather Watch Criteria:

Whenever a geographical area has been dry for a week or two (or for a shorter period if before spring green-up or after fall color), the National Fire Danger Rating System (NFDRS) is high to extreme and critical weather conditions are expected then a Fire Weather Watch should be considered. Before issuing a Fire Weather Watch, coordinate your concerns with the United States Forest Service or Michigan Department of Natural Resources. Consider a watch, whenever the above conditions will combine with these forecast weather parameters within the next 24 to 48 hours are:

1. Sustained wind averaging ≥ 15 mph (20 ft RAWs winds) or ≥ 20 mph (10m ASOS winds)
2. Relative humidity ≤ 25 percent
3. Temperature ≥ 75 degrees.

(Frequent wind gusts reaching the above wind criteria may be used in place of sustained winds at WFO's APX and GRR. This is to increase flexibility and provide additional support when needed to National Forest lands; and to account for differences in land use and fuel types that may be more sensitive to potential wildfire spread across portions of Northern and Western Lower Michigan.)

Red Flag Warning Criteria:

A Red Flag Warning will be issued when the Fire Weather Forecaster has a high degree of confidence that critical weather conditions, listed below, will occur within the next 12 to 24 hours.

1. Sustained wind averaging ≥ 15 mph (20 ft RAWs winds) or ≥ 20 mph (10m ASOS winds)
2. Relative humidity ≤ 25 percent and
3. Temperature ≥ 75 degrees.

(Frequent wind gusts reaching the above wind criteria may be used in place of sustained winds at WFO's APX and GRR. This is to increase flexibility and provide additional support when needed to National Forest lands; and to account for differences in land use and fuel types that may be more sensitive to potential wildfire spread across portions of Northern and Western Lower Michigan.)

Issuing a Red Flag Warning or Fire Weather Watch:

1. Call the affected land management agency for the zone where the watch or warning was issued to inform them of the warning and to coordinate what information is to be included in any public statement.
2. Start an event folder (much like a severe weather package). Included in the package will be an event log (appendix D), and all fire related products issued during the Red Flag event (RFW, FWF, FWS, FWM).
3. Issue the Red Flag Warning as ARBRFWxxx.
4. The warning will include the geographic area, duration of the event and key weather parameters.
5. Headline in the daily Fire Weather Forecast (ARBFWFxxx).
6. Subsequent Red Flag Warning messages or routine weather forecasts will carry the warning or watch headline until it is canceled.

Fire Weather Watch/Red Flag Warning Cancellation/Expiration:

1. Call Land Management officials.
2. Issue the ARBRFWAPX cancels the watch or warning.
3. Headline the cancellation in the daily Fire Weather Forecast.

Non-routine services:

As in years past, the National Weather Service will assist any Federal or State agency in training purposes. Typically, the National Weather Service has served as instructors for the weather portions of the S-290 and S-190 hosted by the USFS or DNR. On different occasions, the National Weather Service has also agreed to supply training/instruction support for state and federal agencies in more general purposes, such as seasonal outlooks during late winter staff meetings or regional gatherings. This type of service will continue in the future.

Verification: Fire Weather Watches and Red Flag Warnings will be verified based on dry thunderstorm and synoptic events. Verification of Red Flag events will be tracked for all fire weather zones. The criteria are as stated previously.

In order to determine if events have happened, forecasters should use all information available to them such as; surface observations, satellite, radar data, RAWS data and the land

management agencies' weather observations. Also, forecasters should use experience, judgment, objectivity, consistency when verifying.

Wildland Fire Agency Responsibilities:

The agency responsibility will be as noted in the Interagency Agreement for Meteorological Services, between federal and state user agencies and the National Weather Service. This has been appended.

Effective Date of the AOP:

The beginning and ending dates of the fire weather season are determined by federal and state agencies in coordination with the National Weather Service Fire Weather Program Leader at the respective weather forecast office. These dates are a function of the first or last snow and by the state of vegetation. Typically the fire weather season for Lower Michigan extends from mid-March through mid-November.

Appendix A

Obtaining Fire Weather Observations:

The past year has seen a great deal of expansion to the access of RAWS and other sources of real time weather data for the fire weather purposes. The original three RAWS sites have expanded as satellite uplinks are now possible. There are many ways to get to these fire weather observations. The main source for observations is the ROMAN page (<http://raws.wrh.noaa.gov/roman>).

There are links to this page on each of The National Weather Service offices web pages that serve the Lower Peninsula.

Appendix B

Spot Forecast instructions

Instructions for Submitting a Spot Forecast request via the internet - user agency:

- From the respective NWS Homepage click on Fire Weather under Forecasts.
- Click on the county where the fire or burn is or will take place.
- Click on submit a new spot request
- Enter data into the request form (red means a mandatory entry)
- Click submit request at the bottom of the form
- After a period of time, check the status of your request from the Spot Forecast page.
- If your request status is listed as complete (color in red on the map), then click on your request, to see the forecast.
- If there is a question on about the forecast from the forecaster, the Spot will be purple. Click on the spot and look at the question from the forecaster.
- If you have feedback on the forecast, at the bottom of the completed forecast is a space to type in feedback, then push the button <Send Feedback>.

Instructions for completing a Spot Forecast request via the Internet - NWS:

- When a request for a Spot Forecast is submitted, an alarm will be posted to AWIPS.
- Go to the Spot Forecast page, and click on the latest Spot Forecast request.
- Near the bottom of the page, click on Initialize forecast.
- Click initialize
- Click on edit forecast
- Edit the forecast and save edits
- Near the bottom, click on send forecast
- The question is posted, do you want to send the forecast?, click send forecast.
- After about 5 to 10 minutes the product FWSXXX will automatically get into AWIPS.

Instructions for completing a Spot Forecast request via the Phone - NWS:

- After receiving the Spot request on the phone, go to the respective office fire page (either through the office intranet or the internet home page), and click on Submit a New Spot Forecast Request
- Click on submit a new request
- Enter data into the request form (red means mandatory entry)
- Click submit request at the bottom of the form
- When the request is submitted, an alarm will be posted to AWIPS
- Go to the Spot Forecast page, and click on the latest Spot Forecast request.
- Near the bottom of the page, click on Initialize forecast.
- On the next page, Click initialize
- Click on edit forecast
- Edit the forecast and save edits
- Near the bottom click on send forecast
- The question is posted, "do you want to send the forecast?" Click send forecast

- After about 5 to 10 minutes the product FWSXXX will be sent from the webpage server into AWIPS. If your system doesn't already print out the system automatically, then print out the forecast and Fax or call the requesting agency with the forecast
- File the forecast in the Completed Fire Weather Request Forms slot.

...FIRE WEATHER WATCH IN EFFECT FRIDAY AFTERNOON FOR SOUTHWEST IDAHO FOR LOW HUMIDITY AND WEST WINDS...

THE NATIONAL WEATHER SERVICE IN BOISE HAS ISSUED A FIRE WEATHER WATCH FOR FRIDAY AFTERNOON FOR SOUTHWEST IDAHO INCLUDING THE LOWER SNAKE RIVER BLM DISTRICT. THOUGH FRIDAY WILL BE A BIT COOLER...WEST WINDS WILL PICK UP AGAIN IN THE 15 TO 25 MPH RANGE AND HUMIDITY MAY BE LOW ENOUGH TO PRODUCE CRITICAL FIRE BEHAVIOR BY FRIDAY AFTERNOON.

Appendix D

Explanation of Fire Weather indices:

Haines Index (Low elevations):

The Haines index is an Atmospheric severity Index used to determine fire severity due to the stability of the lower atmosphere, typically used for days when plume dominated fires are likely. The terms in the index are the lapse rate between 950mb and 850mb (F1) and the moisture availability at 850mb by calculating the dewpoint depression (F2). Once the lapse rate and dewpoint depressions have been calculated, look up the appropriate value for each term (A and B) and add the numbers together (A+B). The lowest the index will be is 2 and the highest is 6.

$$\text{Haines Index} = A + B$$

$$F1 = T950 - T850$$

$$F1 = 3 \text{ deg C or less then} \quad A = 1$$

$$F1 = 4-7 \text{ C then} \quad A = 2$$

$$F1 = 8 \text{ deg C or more then} \quad A = 3$$

$$F2 = T850 - Td850$$

$$F2 = 3 \text{ deg C or less then} \quad B = 1$$

$$F2 = 4-7 \text{ C then} \quad B = 2$$

$$F2 = 8 \text{ deg C or more then} \quad B = 3$$

Ventilation Index:

This index is found by multiplying the mixing height (feet) with the transport wind speed (mph), then dividing by 100.

Example...

Mixing height = 14,000 feet

Transport wind = 15 mph

$$VI = 14,000 * 15 / 100 = 2100 \text{ (no units)}$$

Example...

Mixing height = 5,000 feet

Transport wind = 10 mph

$$VI = 5,000 * 10 / 100 = 500 \text{ (no units)}$$

VI scale...

Less than 130 = POOR dispersal

130 – 299 = FAIR dispersal

300 – 599 = GOOD dispersal

600 and greater = EXCELLENT dispersal

A ventilation index of zero implies no ability for the atmosphere to disperse smoke or pollutants, while a value of 600 or greater implies an excellent ability to disperse smoke or pollutants. The United States Forest Service and Department of Natural Resources has requested that when the VI is “fair”, that we include a number value along with the term.
